

Exploring loci of points by DGS and CAS

CADGME 2012

Jakub Jareš

University of South Bohemia, Czech Republic

22. - 24.06.2012

Jakub Jareš

- 1st year PhD. student Theory of education in mathematics, University of South Bohemia

- Interested in searching for Loci of points with computer

- What are loci of points?

- What are loci of points?
 - Loci of points belong to difficult topics of school curricula at all levels of mathematics education

- What are loci of points?
 - Loci of points belong to difficult topics of school curricula at all levels of mathematics education
 - There are many interesting loci of points which students can recognize (students can also do experiments)

- What are loci of points?
 - Loci of points belong to difficult topics of school curricula at all levels of mathematics education
 - There are many interesting loci of points which students can recognize (students can also do experiments)
- What technologies can we use?

- What are loci of points?
 - Loci of points belong to difficult topics of school curricula at all levels of mathematics education
 - There are many interesting loci of points which students can recognize (students can also do experiments)
- What technologies can we use?
 - Suitable to use DGS (dynamic geometry system) and CAS (computer algebra system)

DGS benefits to Loci of points

CADGME
2012

Jakub Jareš

- The development of computers and mathematical software allows such activities that previously were not possible:

DGS benefits to Loci of points

CADGME
2012

Jakub Jareš

- The development of computers and mathematical software allows such activities that previously were not possible:
 - Dynamic pictures (construction) and possibility to move with objects (points) - we can create the hypothesis using DGS (using **trace of point**)

DGS benefits to Loci of points

CADGME
2012

Jakub Jareš

- The development of computers and mathematical software allows such activities that previously were not possible:
 - Dynamic pictures (construction) and possibility to move with objects (points) - we can create the hypothesis using DGS (using **trace of point**)
 - Verification of hypothesis in DGS (button **locus**)

DGS benefits to Loci of points

CADGME
2012

Jakub Jareš

- The development of computers and mathematical software allows such activities that previously were not possible:
 - Dynamic pictures (construction) and possibility to move with objects (points) - we can create the hypothesis using DGS (using **trace of point**)
 - Verification of hypothesis in DGS (button **locus**)
 - **But!!!** DGS are based on numerical calculations, the result can not be considered **absolutely true**

Using DGS in exploring loci of points

- There exist many DGS systems with some minor differences which behave in a similar way when obtaining loci

Using DGS in exploring loci of points

- There exist many DGS systems with some minor differences which behave in a similar way when obtaining loci
- In general, two objects must be selected:

Using DGS in exploring loci of points

CADGME
2012

Jakub Jareš

- There exist many DGS systems with some minor differences which behave in a similar way when obtaining loci
- In general, two objects must be selected:
 - **driving point** or **mover** (as name says it is bound to a path)

Using DGS in exploring loci of points

CADGME
2012

Jakub Jareš

- There exist many DGS systems with some minor differences which behave in a similar way when obtaining loci
- In general, two objects must be selected:
 - **driving point** or **mover** (as name says it is bound to a path)
 - **locus point** (must depend somehow on the first one)

Using DGS in exploring loci of points

CADGME
2012

Jakub Jareš

- There exist many DGS systems with some minor differences which behave in a similar way when obtaining loci
- In general, two objects must be selected:
 - **driving point** or **mover** (as name says it is bound to a path)
 - **locus point** (must depend somehow on the first one)
- Since the element dependency is preserved the **driving point** traverses its path, **the locus is a trajectory** of the **locus point**.

Exploring loci by DGS

CADGME
2012

Jakub Jareš

- To formulate a problem to students

Exploring loci by DGS

CADGME
2012

Jakub Jareš

- To formulate a problem to students
 - we construct the problem with DGS

Exploring loci by DGS

CADGME
2012

Jakub Jareš

- To formulate a problem to students
 - we construct the problem with DGS
 - we can guess, what it can be

Exploring loci by DGS

Jakub Jareš

- To describe and demonstrate the problem by DGS and
 - move with the **driving point**

Exploring loci by DGS

CADGME
2012

Jakub Jareš

- To describe and demonstrate the problem by DGS and
 - move with the **driving point**
 - watch, what locus is generated with **locus point**

Exploring loci by DGS

CADGME
2012

Jakub Jareš

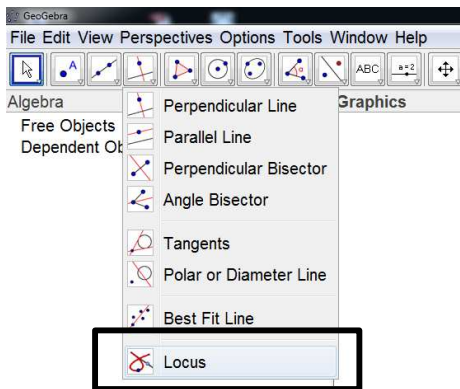

- To describe and demonstrate the problem by DGS and
 - move with the **driving point**
 - watch, what locus is generated with **locus point**
 - discuss with students about, what the locus can be

Exploring loci by DGS

CADGME
2012

Jakub Jareš

- To verify the locus, we can use a button **LOCUS** and we obtain the curve, but only in plane / 2D

To identify locus we need locus equations or its characteristic property

- Translation of a geometry problem into equations or inequations

To identify locus we need locus equations or its characteristic property

- Translation of a geometry problem into equations or inequations
- The use of CAS to obtain locus equation from the system of equations or inequations

Exploring loci by CAS

CADGME
2012

Jakub Jareš

To identify locus we need locus equations or its characteristic property

- Translation of a geometry problem into equations or inequations
- The use of CAS to obtain locus equation from the system of equations or inequations
- Elimination of variables is necessary

To identify locus we need locus equations or its characteristic property

- Translation of a geometry problem into equations or inequations
- The use of CAS to obtain locus equation from the system of equations or inequations
- Elimination of variables is necessary
 - Gröbner basis of ideals

To identify locus we need locus equations or its characteristic property

- Translation of a geometry problem into equations or inequations
- The use of CAS to obtain locus equation from the system of equations or inequations
- Elimination of variables is necessary
 - Gröbner basis of ideals
 - Characteristic sets

Elimination of variables is a basic procedure in exploring loci.

- Realize that we eliminate variables in the system of **non-linear** algebraic equations.
- By elimination we used the program CoCoA which is freely distributed at
`http://cocoa.dima.unige.it`.
It is based on Gröbner basis of ideals.
- Another elimination program is Geother which is freely distributed at
`http://www-calfor.lip6.fr/~wang/epsilon/`.
It is based on Wu–Ritt characteristic sets.

Asteroid

introduction

CADGME
2012

Jakub Jareš

Problem:

Let k be a circle centered at O and two perpendicular lines x , y through point O . Denote A , B the feet of perpendicular lines dropped to x , y from an arbitrary $C \in k$. Let M be an intersection of a segment AB and perpendicular line from C to AB .

Find the locus M when C moves along circle k .

First we construct with GeoGebra this problem. Using the button LOCUS we construct the locus of M when C moves along k .

Asteroid

introduction

CADGME
2012

Jakub Jareš

”It looks like curve of asteroid”

We have no equation

Is it true ?

What is the solution?

Cooperation between

DGS and CAS

is needed!

Asteroid

locus equations

CADGME
2012

Jakub Jareš

Place a coordinate system so that $A = [p, 0]$, $B = [0, q]$,
 $C = [p, q]$, $M = [m, n]$ and let k be a circle with the equation
 $k : x^2 - y^2 - a^2 = 0$.

We **translate** the geometry situation into the set of polynomial equations.

$$M \in AB \Rightarrow H_1 : qm + pn - pq = 0,$$

$$M \in a \Rightarrow H_2 : pm - qn - p^2 + q^2 = 0.$$

Further

$$C \in k \Rightarrow H_3 : p^2 - q^2 - a^2 = 0$$

Asteroid

locus equations

CADGME
2012

Jakub Jareš

We get the system of three equations $H_1 = 0$, $H_2 = 0$, $H_3 = 0$ in variables p, q, m, n, a .

To find the locus of $M = [m, n]$ we **eliminate** variables p, q in the ideal $I = (H_1, H_2, H_3)$ to get a relation in m, n which depends on a . We enter in CoCoA

```
UseR ::= Q[p, q, m, n, a];  
I := Ideal(qm + pn - pq, pm - qn - p^2 + q^2, p^2 + q^2 - a^2);  
Elim(p..q, I);
```

Asteroid

locus equations

CADGME
2012

Jakub Jareš

and get

$$\text{Ideal}\left(-\frac{2}{9}m^6a^2 - \frac{2}{3}m^4n^2a^2 - \frac{2}{3}m^2n^4a^2 - \frac{2}{9}n^6a^2 + \frac{2}{3}m^4a^4 - \frac{14}{3}m^2n^2a^4 + \frac{2}{3}n^4a^4 - \frac{2}{3}m^2a^6 - \frac{2}{3}n^2a^6 + \frac{2}{9}a^8\right).$$

Solve equation

$$-\frac{2}{9}m^6a^2 - \frac{2}{3}m^4n^2a^2 - \frac{2}{3}m^2n^4a^2 - \frac{2}{9}n^6a^2 + \frac{2}{3}m^4a^4 - \frac{14}{3}m^2n^2a^4 + \frac{2}{3}n^4a^4 - \frac{2}{3}m^2a^6 - \frac{2}{3}n^2a^6 + \frac{2}{9}a^8 = 0$$

get

$$n^2 - (a^{2/3} - m^{2/3})^3 = 0$$

Asteroid

locus equations

CADGME
2012

Jakub Jareš

The equation can be expressed as a **function** of two variables m, n

$$n = \pm \sqrt{(a^{2/3} - m^{2/3})^3}$$

Or we can display the function as an **implicitplot**, when $a = 1$

$$\text{Ast} := -2/9m^6 - 2/3m^4n^2 - 2/3m^2n^4 - 2/9n^6 + 2/3m^4 - 14/3m^2n^2 + 2/3n^4 - 2/3m^2 - 2/3n^2 + 2/9 = 0$$

The locus above was found by algebraic and computer tools.

Jakub Jareš

Strophoid

introduction

CADGME
2012

Jakub Jareš

Problem:

Let ABC be a triangle with the given side AB and the vertex C on a circle k centered at A and radius $|AB|$.

Find the locus of the orthocenter M of ABC when C moves on k .

First we construct in GeoGebra the triangle ABC with the point C on the circle k . Using the button LOCUS we construct the locus of the orthocenter M when C moves along k .

Strophoid

introduction

CADGME
2012

Jakub Jareš

Strophoid

locus equations

CADGME
2012

Jakub Jareš

Derivation of the locus is as follows:

Suppose that $A = [0, 0]$, $B = [a, 0]$, $C = [p, q]$ and $M = [m, n]$.

Then:

$$M \in h_{AB} \Rightarrow H_1 : m - p = 0,$$

$$M \in h_{BC} \Rightarrow H_2 : (p - a)m + qn = 0,$$

$$C \in k \Rightarrow H_3 : p^2 + q^2 - a^2 = 0.$$

Strophoid

locus equations

CADGME
2012

Jakub Jareš

Elimination of p, q in the system $H_1 = 0, H_2 = 0, H_3 = 0$ gives
in the program Epsilon

with(epsilon);

$U := [m - p, (p - a) * m + q * n, p^2 + q^2 - a^2] :$

$X := [m, n, p, q] :$

CharSet(U, X);

the equation

$$an^2 - m^2a + m^3 + mn^2 = 0$$

which is the equation of a cubic curve called **strophoid**.

Strophoid

locus equations

CADGME
2012

Jakub Jareš

Solve this equation

$$\text{solve}(a * n^2 - m^2 * a + m^3 + m * n^2 = 0, n^2);$$

and get

$$n^2(a + m) - m^2(a - m) = 0$$

The equation can be expressed as a function of two variables
 m, n

$$n = \pm m \cdot \sqrt{\frac{a - m}{a + m}}$$

Strophoid - results

function of two variables

CADGME
2012

Jakub Jareš

Strophoid space

introduction

CADGME
2012

Jakub Jareš

We try to do this problem in space:

Problem:

Let ABC be a triangle with the given side AB and the vertex C on a ball κ centered at A and radius $|AB|$.

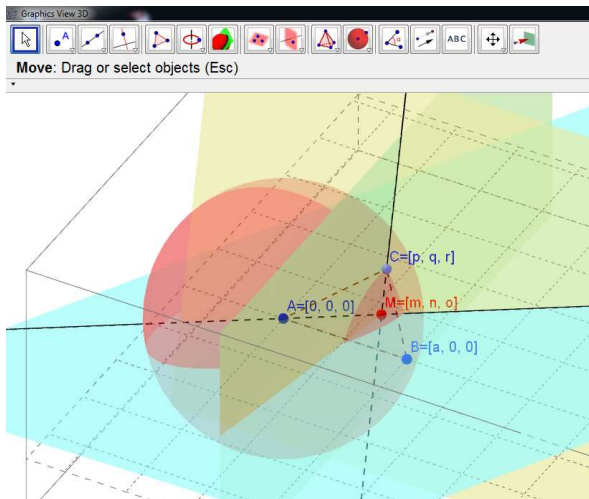

Find the locus of the orthocenter M of ABC when C moves on κ .

Strophoid space

introduction

CADGME
2012

Jakub Jareš

Strophoid space

introduction

CADGME
2012

Jakub Jareš

Strophoid space

locus equations

CADGME
2012

Jakub Jareš

Place a coordinate system so that $A = [0, 0, 0]$, $B = [a, 0, 0]$, $C = [p, q, r]$, $M = [m, n, o]$ and let κ be a ball in the center A with the equation $\kappa : x^2 + y^2 + z^2 - a^2 = 0$.

We translate the geometry situation into the set of polynomial equations.

$$M \in \rho_1 \Rightarrow H_1 : m - p = 0,$$

$$M \in \rho_2 \Rightarrow H_2 : pm + qn + ro - pa = 0,$$

$$M \in ABC \Rightarrow H_3 : -arn + aqo = 0,$$

$$C \in \kappa \Rightarrow H_4 : p^2 + q^2 + r^2 - a^2 = 0.$$

Strophoid space

locus equations

CADGME
2012

Jakub Jareš

We get the system of four equations $H_1 = 0$, $H_2 = 0$, $H_3 = 0$ and $H_4 = 0$ in variables p, q, r, m, n, o, a .

To find the locus of $M = [m, n, o]$ we **eliminate** variables p, q, r in the ideal $I = (H_1, H_2, H_3, H_4)$ to get a relation in m, n, o which depends on a . We enter in CoCoA

```
UseR ::= Q[p, q, r, m, n, o, a];  
I := Ideal(m - p, pm + qn + ro - pa, -arn + aqo,  
p2 + q2 + r2 - a2);  
Elim(p..r, I);
```

Strophoid space

locus equations

CADGME
2012

Jakub Jareš

and get

$$\text{Ideal}(m^4a + m^2n^2a + m^2o^2a - 2m^3a^2 + m^2a^3 - n^2a^3 - o^2a^3)$$

Factor this equation in Maple and get

$$a(-m + a)(am^2 - an^2 - ao^2 - m^3 - mn^2 - mo^2) = 0.$$

Equation

$$am^2 - an^2 - ao^2 - m^3 - mn^2 - mo^2 = 0$$

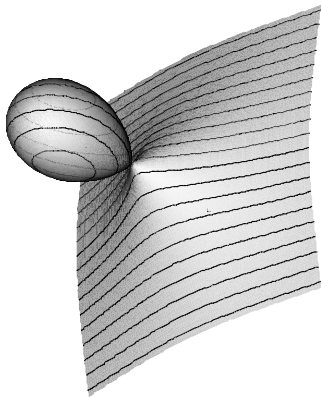

is equation of our searching locus.

Strophoid space - results

implicitplot $am^2 - an^2 - ao^2 - m^3 - mn^2 - mo^2 = 0$

CADGME
2012

Jakub Jareš

Strophoid space - results

implicitplot $am^2 - an^2 - ao^2 - m^3 - mn^2 - mo^2 = 0$ with sphere
