Full title of your paper with Proper nouns[1]

Jelena Aleksić [2] **and Aleksandar Pavlović** [3] [4]

Abstract.
Write your abstract here. It should concisely summarize the results of the paper...

AMS Mathematics Subject Classification (2020): 00A11; 55B55

Key words and phrases: first keyword; second keyword; third keyword

1. Introduction

This sample file provides the basic rules and examples for preparing a manuscript for the *Novi Sad Journal of Mathematics* (NSJOM). Our goal is to ensure a high-quality publication with fully functional PDF features, including active hyperlinks, cross-references, and properly formatted citations.

To maintain consistency and facilitate the editorial process, authors must strictly follow the technical requirements listed below. For more detailed "step-by-step" guidance, please also refer to the **comments within the LaTeX source code** of this template.

1.1. Key Technical Requirements

- **Author Order:** According to NSJOM editorial policy, authors should be listed in *alphabetical order* by their surnames.
- **ORCID iD:** Providing a valid ORCID iD for each author is mandatory. If any author lacks one, please register at `https://orcid.org`.
- **BibTeX Integration:** The manual `thebibliography` environment is no longer accepted. Authors must use a separate `.bib` file. Each entry must include metadata such as **MR (MathSciNet)** and **DOI** numbers where available. We recommend using *Mref* (`https://mathscinet.ams.org/mref`) for generating accurate BibTeX code.
- **Equations and Margins:** Please ensure that large equations do not exceed the page margins. Since LaTeX does not automatically break long formulas, authors are responsible for manually applying line breaks (e.g., using `split` or `aligned`). **Failure to do so may require technical adjustments during typesetting, which carries a risk of misinterpreting the intended mathematical structure.**

[1]This is one place where you can put acknowledgement

[4]Corresponding author

- **Template Adherence:** To maintain a uniform appearance, do not alter the structural commands or page geometry. The official package contains 5 essential files: the `nsjom.sty` style file (must be in the same directory), the `NSJOMSample.tex` source, the `NSJOMBIB.bib` bibliography template, the `PMF.jpg` example image, and the `NSJOMSample.pdf` for reference. The complete package can be downloaded from: `https://sites.dmi.uns.ac.rs/nsjom/template/NSJOM_SAMPLE.zip`.

Please use the journal's predefined theorem environments WITHOUT modifying their definitions in the preamble. However, authors may define additional environments (e.g., using `\newtheorem`) if the standard ones do not cover their specific needs. Proper use of labels (`\label`) and references (`\ref`) is essential for maintaining a dynamic and error-free manuscript. Should you require further clarification, please contact the editorial office at: nsjom@dmi.uns.ac.rs.

2. Definitions and Theorems

All definitions, theorems, lemmas, and remarks must be placed within their appropriate environments.

For citations within the text, please note that we use a package that automatically compresses citation sequences. Regardless of this, **authors must list every BibTeX key individually** within the `\cite` command. For example, typing `\cite{ref1, ref4, dm2, Mar, ref3}` results in a sorted and compressed display: [1–5]. This procedure ensures that **all relevant entries from your BibTeX file are correctly captured and displayed** in the document's bibliography. Note that any entry in the `.bib` file that is not explicitly cited in the text will be automatically excluded from the final PDF. You may also include specific notes, such as `\cite[Theorem 2.1]{Mar}`, which will be rendered as [4, Theorem 2.1].

Definition 2.1. This is a standard definition environment.

You can also include a source or a name within the optional brackets:

Definition 2.2 ([2])**.** This is a definition that cites a specific source.

Theorem 2.3. *This is a sample of a theorem. By using a label, we can easily refer to this theorem later as Theorem 2.3.*

Remark 2.4 (Gauss). This is a remark environment with an attribution to a specific person.

3. Main Results

Theorem 3.1. *Every theorem should be followed by its proof when applicable.*

Proof. The proof has its own environment, which automatically ends with a QED symbol (square). □

Lemma 3.2. *There holds*

$$1 + 1 = 2. \tag{3.1}$$

Proof. The proof of Equation (3.1) is easy. Please use `\eqref` for referencing equations and `\ref` for other environments. □

It is essential to use labels for easy cross-referencing. For example, Theorem 3.1 demonstrates the use of the *proof* environment.

3.1. Figures and images

You may use color pictures; they will be visible in the online version, while the print version will be in grayscale.

Figure 1: Faculty of Sciences, Novi Sad.

Refer to images in the text as Figure 1.

Acknowledgement

This is the place to acknowledge grants, projects, or individuals who contributed to the research.
